What is a flexible PV mounting structure?

Flexible PV Mounting Structure Geometric ModelThe constructed flexible PV support model consists of six spans,each with a span of 2 m. The spans are connected by struts,with the support cables having a height of 4.75 m,directly supporting the PV panels. The wind-resistant cables are 4 m high and are connected to the lower ends of the struts.

Why are flexible PV mounting systems important?

Traditional rigid photovoltaic (PV) support structures exhibit several limitations during operational deployment. Therefore,flexible PV mounting systems have been developed. These flexible PV supports,characterized by their heightened sensitivity to wind loading,necessitate a thorough analysis of their static and dynamic responses.

What is a flexible PV support structure?

The baseline, unreinforced flexible PV support structure is designated as F. The first reinforcement strategy involves increasing the diameter of the prestressed cables to 17.8 mm and 21.6 mm, respectively. These configurations are named F1-1 and F1-2 for ease of comparison.

However, the increased availability of thin-film photovoltaic modules opens up possibilities for the application of flexible solar panels on irregularly curved surfaces, including the integration ...
