

What is a microgrid & how does it work?

Microgrids can be classified as Closed Distribution Systems or Energy Communities. Microgrids are decentralised electricity systems that can operate independently of the main electricity network, and which have the potential to contribute to the energy transition towards a more sustainable energy mix.

Can microgrids help DERs in the electricity market?

Microgrids, however, have the potential to facilitate the integration of DERs in the electricity market (Warneryd et al., 2020). A microgrid is a decentralised grid which can disconnect from the main electricity grid and structure into 'local sub-grids that manage their power and energy balancing' (Pinto et al., 2021).

Can microgrids contribute to the energy transition?

Microgrids have the potential to positively contribute to the energy transition. Legal uncertainty discourages the development of microgrids. Microgrids can be regulated based on different microgrid ownership and operation models. Microgrids can be classified as Closed Distribution Systems or Energy Communities.
