

Secondary use of wind turbine blades

The aim of this article is to provide a system-level review of current end-of-life strategies for wind turbine components, with particular emphasis on blade recycling and decision-oriented ...

Extending the life cycle, reducing waste, and enhancing the recycling of wind turbine materials are important strategies to promote and reduce the environmental impact of wind energy systems. These ...

We explore the structural composition of wind turbine blades, the environmental and economic implications of their disposal, and the potential for energy recovery and waste management.

Wind turbine blades make up less than 8% of the total wind turbine's mass; however, recycling of blades has proven to be more challenging because of the materials and methods used to make them.

Repurposing turbine blades delivers a double win. Environmentally, it keeps massive, non-biodegradable materials out of landfills and reduces the need for virgin raw materials.

According to researchers, 10-15% of the used materials are wasted during blade fabrication and then disposed of in landfills (Almeida et al., 2022). Most of the waste produced is ...

Wind blade recycling is now an essential part of building a truly sustainable wind energy industry. Wind turbine blades are engineered for strength, durability, and long service life. Typically ...

As wind turbines become increasingly efficient and powerful, older blades can be reassembled for use in less demanding applications, either in other wind farms or in different second ...

While over 80% of materials in modern wind power installations are recyclable, the sector continues to grapple with the absence of effective, scalable, and environmentally sustainable ...

While most materials in a wind turbine can be recycled at the end of their life, large composite blades are often treated as waste, leading to potential strains on regional landfills, a loss ...
