

Why is plant availability important in a solar PV power plant?

In a solar PV power plant, the plant availability factor is one of the important factors to be evaluated. This depends on the operative functioning of various components and grid regulation.

How to evaluate the availability factors of a solar PV plant?

In this paper, a simple method is proposed to evaluate the availability factors of a solar PV plant by considering the real time data of 1 MWp solar power plant that was commissioned in 2011 in south India. Generation start time, end time, and actual running periods of the inverter were selected as prominent data in the study.

How to calculate availability of solar power plants?

Availability of solar power plants can be calculated using specific methodologies that ensure accurate assessments of their operational efficiency. Here are some key points to consider: 1. Understanding the concept of availability, which is defined as the ratio of the time a plant is operational to the total time it could potentially operate. 2.

What are the availability factors of a 1 MWp solar PV plant?

The evaluated availability factors of the inverter and PV plant for the 1 MWp solar PV under study are summarized as follows: The variation in availability factor is observed to be in the range of 92.44 % to 95.69 % over the five consecutive financial years.
